

Performance Testing

Date	30 September 2026
Team ID	SWTID-2026-2597
Project Name	Streamlining IT Procurement – Automating Standard Laptop Orders with Flow Designer
Maximum Marks	5 Marks

Performance Testing

Performance testing evaluates how the ServiceNow solution behaves under expected request load. The focus is on the Standard Laptop catalog request, Flow Designer execution, and generation of associated tasks.

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow platform / Flow Designer; browser-based request testing
Type of Testing	Load Testing and Response-Time Testing
Target Module / API	Standard Laptop Catalog Item and "Standard laptop task" Flow
Test Environment	ServiceNow development / project instance
Test Date	30 September 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Open the Standard Laptop catalog item and load the request form.	5	60	Page loads within acceptable response time.
2	Submit Standard Laptop requests through the catalog.	5	60	Requests are submitted without errors.
3	Verify Flow Designer execution after request submission.	5	60	Assigned Flow starts and executes successfully.
4	Verify task generation for multiple laptop requests.	10	120	Expected tasks are created without significant delay.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	TBD	TBD	Measure during actual execution.
2	Response Time (Max)	< 5 seconds	TBD	TBD	Measure maximum observed response time.
3	Throughput (Req/sec)	Record baseline	TBD	TBD	Record successfully processed requests per second.
4	Error Rate	< 1%	TBD	TBD	Check failed/errored requests.
5	CPU Utilization	< 80%	TBD	TBD	Record if environment monitoring is available.
6	Memory Utilization	< 80%	TBD	TBD	Record if environment monitoring is available.

Step 4: Observations & Analysis

Key Findings: The test verifies that Standard Laptop requests can be submitted and that the assigned Flow starts and generates the expected tasks under repeated requests. Actual response time, throughput, error rate, CPU utilization, and memory utilization must be recorded from the ServiceNow test environment.

Expected Analysis: The system should maintain stable request processing, avoid failed submissions, and complete Flow execution without significant delay as concurrent requests increase.

Conclusion: Performance acceptance should be confirmed after the actual measurements are entered. The planned test scenarios and target thresholds are documented for the project submission.

Note: "TBD" values are intentionally left for actual ServiceNow execution results and should be replaced with measured values before final submission.
